

Why change your track?

Any snowmobiler can improve the performance and safety of their machine with a new track. It is simply the most sensible and often the most cost-effective modification possible.

A carefully selected new track can provide improved traction for better acceleration, braking, and handling. It can improve floatation and traction for better performance in deep snow. It can reduce weight and drag to improve top speed. And a more efficient track will provide improved gas mileage, too. And besides being less expensive than most other modifications, it can add performance without voiding the all-important manufacturer warranty on a new machine, and without making the machine illegal in any way.

Think about it. It doesn't matter how much horsepower your engine makes or how efficient your clutches are, if the power is not getting to the ground effectively, it is just being wasted. Your track is your link to the snow, so you need a track that puts the power on the snow, not one that throws the white stuff out under your snow flap.

New for the upcoming season, or coming out of summer storage with some miles on it, almost any sled can benefit one way or another from a carefully selected new track. See your Camoplast dealer to discuss the advantages of a new track.
