

TRACKtion™ Control System for studding

Metal track studs are very popular additions in areas with icy trails, especially in hilly terrain, and for ice riding of all kinds because nothing else provides the traction of properly selected and properly installed metal studs.

The Camoplast TRACKtion™ Control System is a series of factory pre-holed tracks co-developed with Woody's to provide the optimum platform for track studding with no worries. These tracks feature enhanced internal belting for added durability. The holes are factory punched to insure that the fabric and reinforcing cords remain correctly positioned during the track manufacturing process, thereby insuring consistency and quality.

The well-proven stud pattern was developed by Woody's, one of the most experienced traction manufacturers in the industry. Instructions on proper stud and washer selection (including part numbers) and proper stud installation procedures are included with the track. So users can stud their track confidently, knowing that they have the best track with the best studs in a well-engineered and matched product system.

And unlike other conventionally studded tracks, Camoplast TRACKtion Control System tracks are covered by a one-year limited warranty from Camoplast, with the studs and related hardware covered by Woody's warranty protection.

Camoplast TRACKtion Control System models are available in RipSaw™, HackSaw™, and Energy™ track models for a wide variety of trail sleds with 121-inch and 136-inch tracks.
